

Glottal Source Parameters for Forensic Voice Comparison: an Approach to Voice Quality in Twins' Voices

Eugenia San Segundo Fernández
Phonetics Laboratory, CSIC, Madrid

International Association for Forensic Phonetics and Acoustics
2012 Annual Conference

7th August 2012 - UIMP Santander

OUTLINE

1. Introduction
 - 1.1. Research on twins' voices
 - 1.2. Research on voice quality
2. Material and method
 - 2.1. Speakers
 - 2.2. Equipment and set-up
 - 2.3. Speech material and Data collection
 - 2.4. Segment selection
 - 2.5. Glottal source features
 - 2.6. Likelihood ratio calculation
3. Results
4. Conclusion
5. Future research

1. Introduction

- **Research on twins' voices**

Monozygotic

Dizygotic

1. Introduction

- **Research on twins' voices**

Lundström, A. (1948)

Nolan, F. and Oh, T. (1996)

Johnson, K. & Azara, M. (2000)

Loakes, D. (2006)

Whiteside, S.P. & Rixon, E. (2003)

Künzel, H. (2010)

Ryalls, J. et al. (2004)

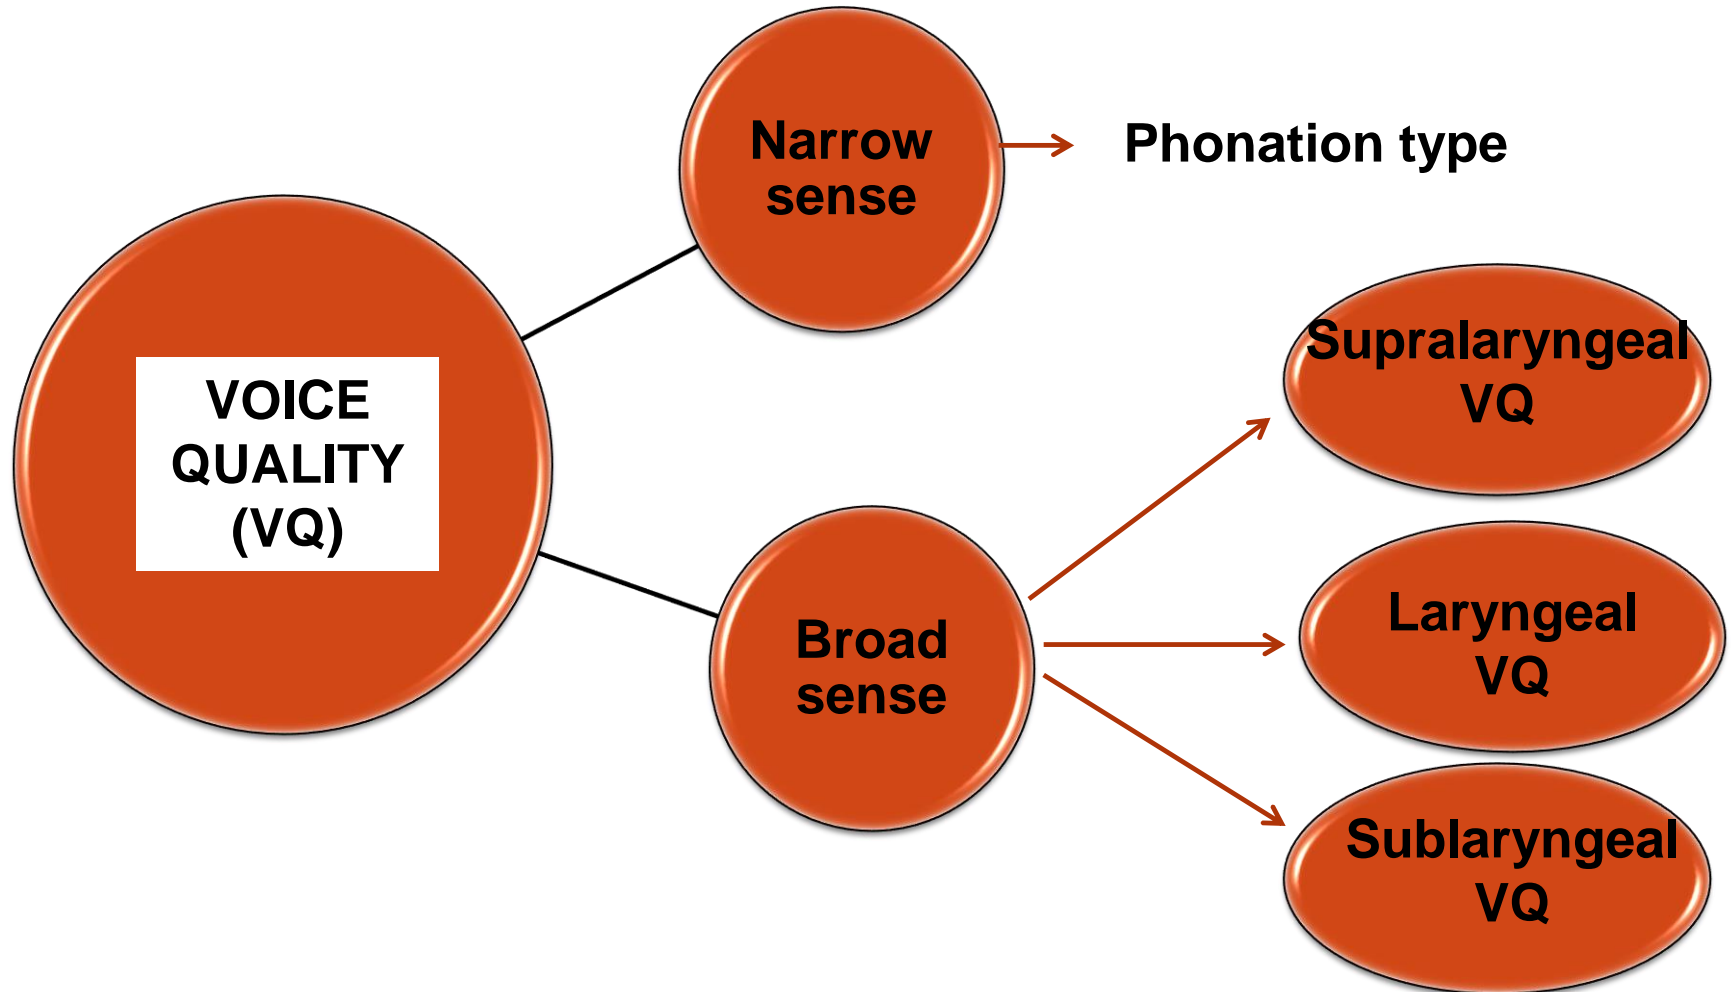

Weirich, M. (2012)

Kovas, Y. et al. (2005)

CONCLUSIONS

1. Introduction

- Research on voice quality

1. Introduction

- **Research on voice quality**

Nolan, F. (1983)
Künzel, H. (1987)
Hollien, H. (1990)
Baldwin, J. & French, P. (1990)
Rose, P. (2002)

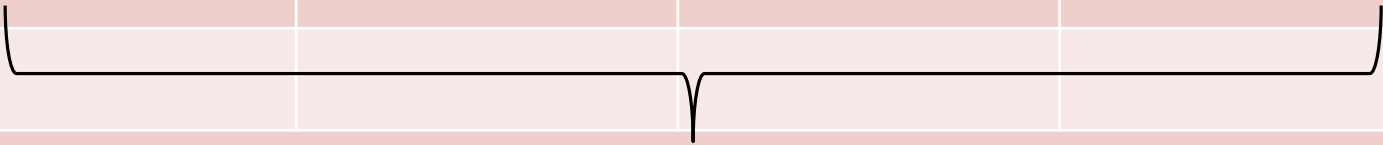

Jessen, M. (1997)
Köster, O. & Köster, J-P.
(2004)
Nolan, F. (2005)
Nolan, F. (2007)

Moosmüller, S. (2001)
Evans, I. & Foulkes, P. (2009)
Czajkowski, A. & Dellwo, W.
(2009)

Wagner, I. (1995)
Farrús, M. et al. (2007)
Gómez-Vilda, P. et al. (2008)
Enzinger, E. et al. (2012)

2. Material and method

- **Speakers**

MZ twins	DZ twins	Brothers	Reference population
6 pairs	4 pairs	2 pairs	8 + 10 = 18 sp.
			
Male			
31.6 years (mean)			
Castillian Spanish			
No voice pathologies			
No hearing difficulties			

2. Material and method

- **Equipment**

Countryman E6i
omnidirectional
flat-frequency response

Roland Cakewalk
UA25EX

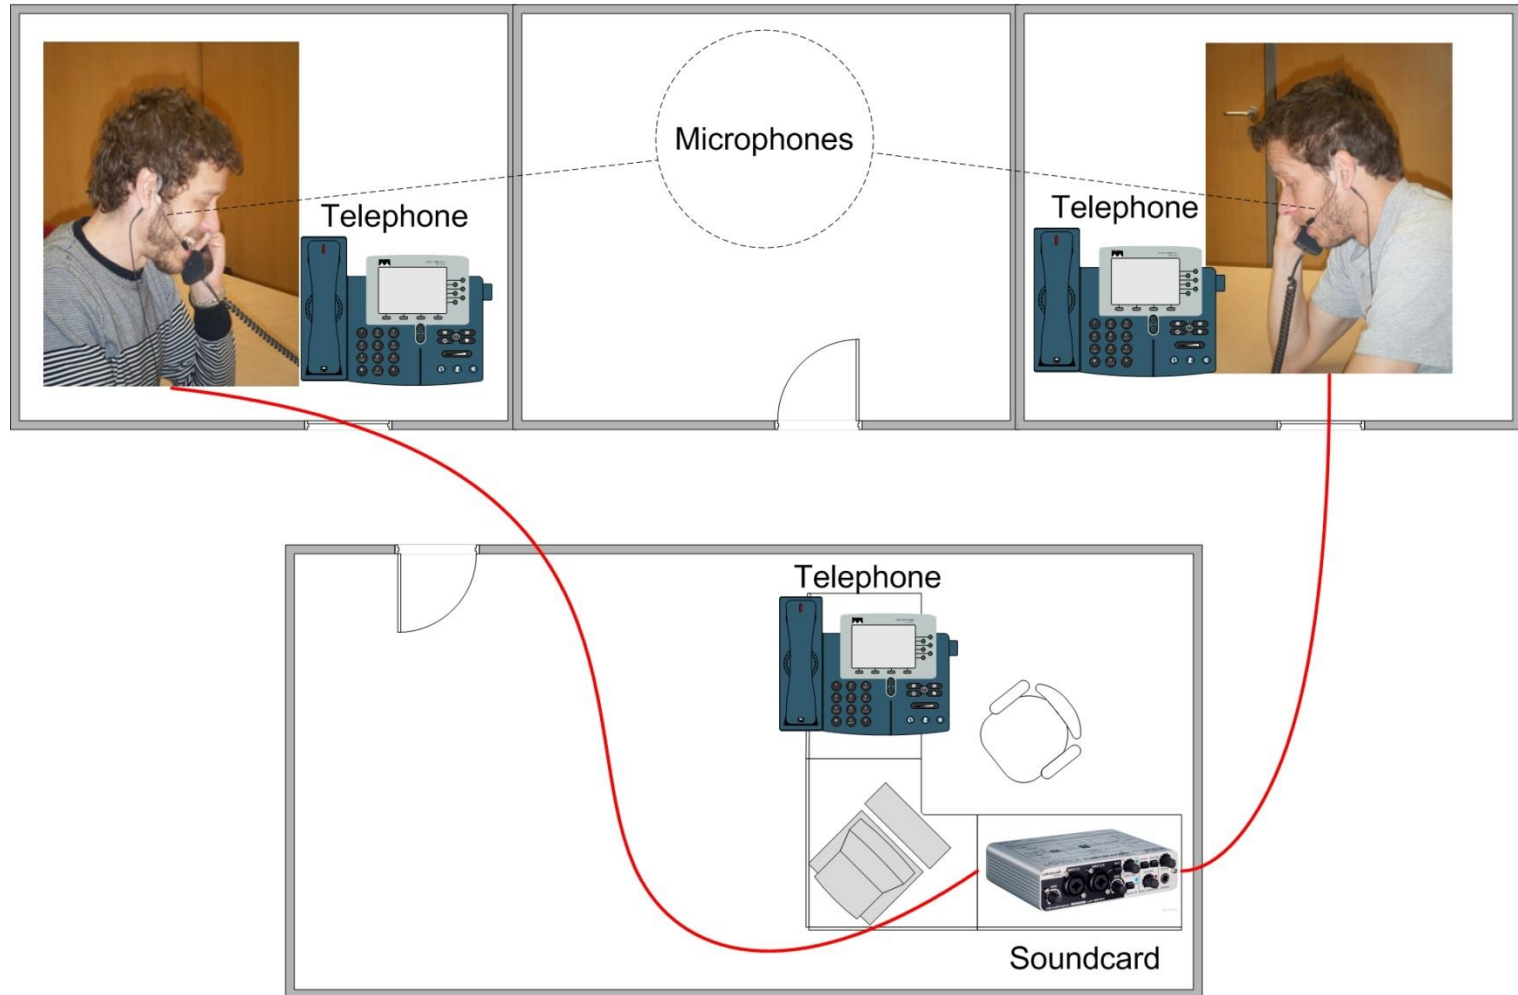

Adobe® Audition®
CS5.5

- 44.1 kHz frequency sampling
- 16 bit amplitude sampling
- raw PCM wave files

2. Material and method

- **Data collection**

2. Material and method

*Morrison, G.S. et al.
(2012 in press)*

- **Data collection**

- 2 non-contemporaneous recordings (2-4 weeks)
- 4 tasks:
 - Task 1- Conversation with brother/twin [close friend]
 - semi-structured informal conversation
 - Labovian “danger of death question”
 - Loakes, D. (2006)
 - Task 4- Conversation / Interview with researcher
 - objective: need to remember → hesitation speech (e.g. pause fillers)
 - Foulkes, P., Carrol, G. and Hughes, S. (2004)
 - Tschäpe, N. et al. (2005), Cicres, J. (2007)

10 min

10 min

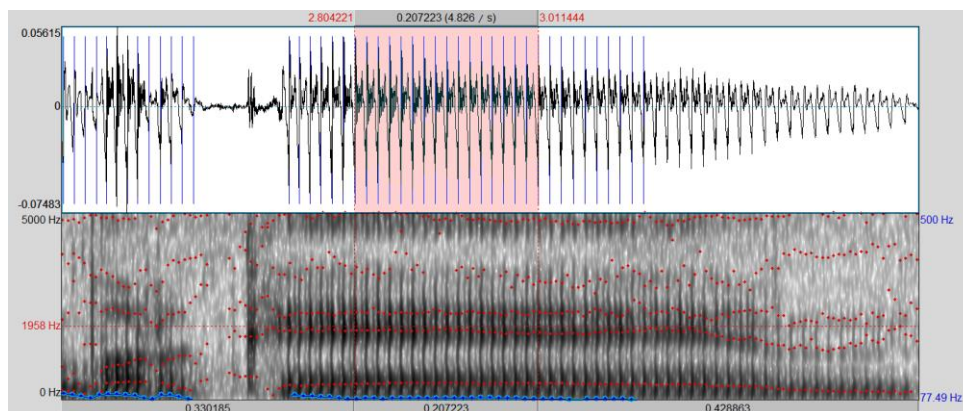

2. Material and method

- **Speech material: pause fillers (PF)**

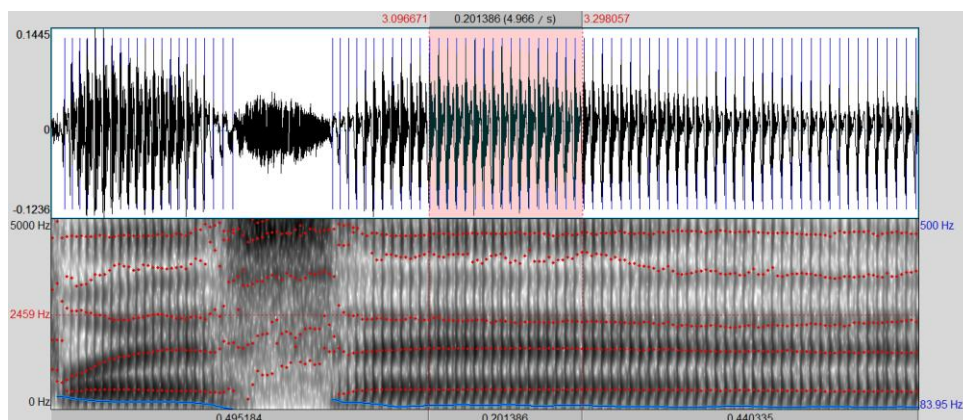

2. Material and method

- **Segment selection:** “eh” [e]
 - while articulating & between silent pauses

- 160-240 milliseconds
- 557 tokens
- 8.5 tokens per recording session per speaker

2. Material and method

- **Glottal source features**

-**Jitter**: ratio between next cycle **duration** difference and their mean

-**Shimmer**: ratio between next cycle **amplitude** difference and their mean

- **Biomechanical estimates** from the vocal fold **body** and **cover**:

- Dynamic mass
- Losses
- Stiffness

GLOTTEx[®]

voice analysis system

version 7.0 March 2012

2. Material and method

- **Likelihood Ratio calculation**

- Cross-validated LR
- MVKD (Aitken and Lucy, 2004) - Morrison, 2007

$$LR = \frac{p(E|H_{so})}{p(E|H_{do})}$$

Sp. 1 (1st session) - Sp. 1 (2nd session)

Sp. 1 (1st session) - Sp. 2 (2nd session)

Sp. 1 (1st session) - Sp. 3 (2nd session)

Sp. 1 (1st session) - Sp. 4 (2nd session)

Sp. 1 (1st session) - Sp. 5 (2nd session)

..... -

➡ **Same-speaker comparison**

➡ **Same-pair comparison**

} **Different-speaker comparisons**

- In each comparison, 3 elements:

SUSPECT

OFFENDER

**BACKGROUND
POPULATION**

3. Results

- Identical (MZ) Twins

SP	JITTER + SHIMMER	JITTER + SHIMMER + BIOMECH.	BODY (all)	COVER (all)	BODY + COVER
1-2	1.41	2.88	1.33	4.03	2.23
3-4	1.23	23.94	4.72	3.70	18.53
5-6	1.47	99.53	4.68	11.41	68.73
7-8	1.16	6.15	4.03	9.93	5.53
9-10	1.11	80.89	3.39	36.87	88.63
11-12	1.28	0.001	0.011	0.003	0.001

3. Results

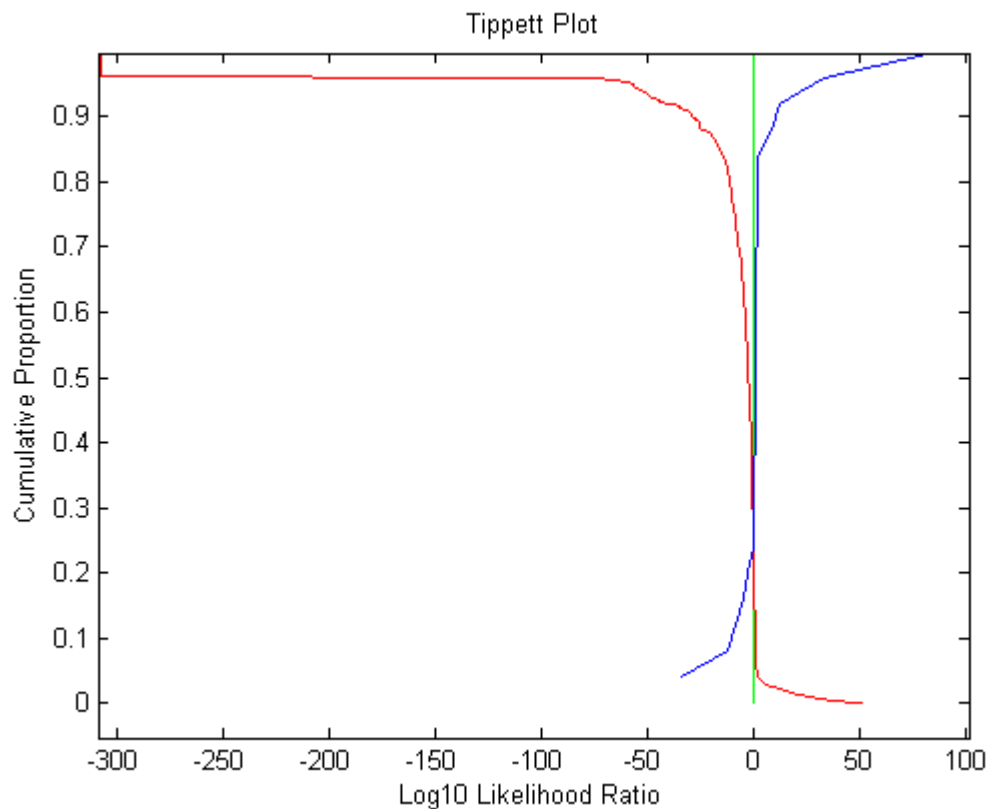

- Non-identical (DZ) Twins

SP	JITTER + SHIMMER	JITTER + SHIMMER + BIOMECH.	BODY (all)	COVER (all)	BODY + COVER
13-14	0.001	4.59E-42	0.003	3.15E-06	8.69E-21
15-16	1.27	0.07	1.47	2.19	0.78
17-18	1.45	0.17	2.73	0.08	0.18
19-20	1.21	0.92	0.29	2.89	1.34

3. Results

- Overall performance

Forensic system:
body + cover
Cllr = 0.706

Forensic system:
body + cover
+ jitter + shimmer
Cllr = 0.655

4. Conclusion

- **Why studying twins?**
 - Low incidence but extreme case of similarity (very challenging conditions)
 - Voice quality perspective: biomechanical estimates
- **Overall better performance:** cover and body parameters
- **Performance in twins:** variation between pairs.
- **Contributions:**
 - Method for eliciting pause fillers
 - Avoid the “observer’s paradox”
 - Ensure everyday interactional style

5. Future research

- **More twins**
- **Siblings**
- **Larger reference population**
- **Other methods for likelihood calculation**
- **Telephone filter**
